Patent Application of James Earl Taulbee III for Recreational Vehicle Awning Hook Hanger

Page 1 of 13

TITLE: RECREATIONAL VEHICLE AWNING HOOK HANGER

CROSS-REFERENCE TO RELATED APPLICATIONS: None.

FEDERALLY SPONSORED RESEARCH: None.

SEQUENCE LISTING: None

FIELD OF INVENTION

The invention is a RV awning hook hanger. Specifically to an improved hanger devise designed to display objects from the utility channel on an awning roller rail of a recreational vehicle, camper, motor home, boat, house, commercial or other building.

BACKGROUND

The use of awnings for recreational vehicles, campers, motor homes, and boats; also awnings mounted to fixed structures such as a house or commercial buildings have become increasingly popular. Consumers desire for comfort, convenience, and the desire for a method to display objects or attachments on an awning roller rail. Several products have come to the market

that enable the user to display objects from the awning roller rail. These products do not easily meet the needs of displaying objects on an awning roller rail without using secondary clips, hooks or clamps. The use of secondary clips, hooks or clamps makes the installation more time consuming, there are also more parts to store, lose or misplace. There are also added costs to manufacture, package, market, and maintain these items. I have listed two patents as examples 1 and 2 as my improvements on prior art.

Example 1: The AWNING HOOK FOR RECREATIONAL VEHICHL E in patent 5,174,536 to Ralf W. Pelletier: Ila Pelletier. This method requires use of secondary hardware to display an object from the awning roller rail with the disadvantages listed as the need to use a secondary slip or "S" hooks. The use of secondary slip hook or "S" hook makes the installation cumbersome and time consuming. There are also more parts to store, lose or misplace with added costs to manufacture, package, market, and maintain.

Example 2: The AWNING ROD BRACKET in patent 5,601,267 to Donald R. Caine. This example also requires use of secondary hardware to display an object from the awning roller rail with the disadvantages listed as the need to use a secondary slip or "S" hooks. The use of secondary slip hook or "S" hook makes the installation cumbersome and time consuming. There are also more parts to store, lose or misplace with added cost to manufacture, package, market, and maintain.

OBJECTS AND ADVANTAGES

Awnings are manufactured with two or more "C" shaped retainer channels that run the full length and parallel to the awning roller rail. One of the retainer channels is used to hold the awning fabric to the awning roller rail. Another retainer channel is used to hold the valance to the awning roller rail. In many cases the same channel is used for the attachment of the main awning fabric and the valance. One of the channels is called a utility channel. This channel is used to hold a deployment strap, also called a pull down strap. The deployment strap is used to pull the awning from a stored position to the open position. The deployment strap also allows users retract the awning in a controlled manner to the stored position, as the awning roller rail is tensioned or spring loaded. The deployment or pull down strap has a radial end to be accepted by the utility channel on the awning roller rail. The utility channel has an opening at one end of the awning roller rail to accept the deployment straps radial end. After opening the awning, the deployment straps radial end can be moved to the end of the awning roller rail and removed from the utility channel to be stored. With the awning in the open position and the deployment strap removed, the unused utility channel can be used to accommodate hanger devices. These hanger devices are designed to slide in the unused utility channel on the awning roller rail. The user slides an appropriate number of hangers into the utility channel on the awning roller rail. After the hangers are positioned or spaced in the utility channel, the user must then insert a hook, clip, or clamp into the awning hanger to hold the desired object.

With consumers desire for convenience, and the desire for a method to display objects on the awning roller rail. Several product have come to the market that enable the user to display rope lights, string lights, or other types of accent or ornamental lighting, also signs, banners,

flags, windsocks or other objects from the awning roller rail. These products do not easily meet the needs of displaying objects on an awning roller rail without using a secondary clip, hook or clamp. The use of secondary clips, hooks or clamps makes the installation more time consuming, as well as there are also more parts to store, lose or misplace, with added cost to manufacture, package, and maintain.

I propose a new awning hook hanger design that eliminates the need to use secondary hardware to display objects from an awning roller rail. The clip’s design will accommodate rope lights, string lights, or other types of accent or ornamental lighting, signs, banners, flags, windsocks, and other objects to the awning roller rail. The clip will be less expensive to manufacture, package, and ship, because no secondary hardware will be required. The consumer will have fewer parts to store, lose or misplace, and faster set up and take down of lights or other items. They are lightweight and being made of a weatherproof material, will last for years. Further objects and advantages of my invention will become apparent to those skilled in the art from a consideration of the drawings and ensuing description.

SUMMARY

The invention of the awning hook hanger was a result of the inventor’s desire for a simpler, and less expensive method of an awning hanger device for displaying objects from an awning roller rail. The awning hook hanger has a hook shaped end to allow users to display items from the hook hanger on the awning roller rail without the use of secondary clip, hook, clamp or other hardware.

DETAILED DESCRIPTION—FIGURES

Figure 1 as illustrated, is a preferred embodiment of the RV awning hook hanger of the present invention. The RV awning hook hanger **10** has two major parts connected to a planar body. First, a radial end **11** that has a substantially cylindrical shape. The radial end **11** includes a core hole **15** to aide in the production molding process. Second, the body of the RV Awning hook hanger **10** includes a hook shaped end **13** designed to allow users to display items from the RV awning hook hanger **10**. The awning hook hanger **10** may be formed by injection molding as is conventional in the trade and can be manufactured from polyvinyl chloride, nylon or other suitable material. The molding material can include ultraviolet inhibitors that will enable the RV hook hangers to withstand outdoor use and last for many years.

Figure 2 illustrates the end view of the awning roller rail **14** with a RV hook hanger **10** installed. The awning roller rail **14** has a utility channel **12** that is designed by the awning manufacturer to accept articles with a substantially cylindrically shaped end. The radial end **11** of the RV hook hanger **10** is manufactured to fit the utility channel **12**.

~~Figure 3 illustrates the front view of the awning roller rail 14 with an awning hook hanger 10 installed in the utility channel 12.~~

~~Figure 4~~ Figure 3 illustrates a three-dimensional drawing of the awning roller rail. The awning roller rail **14** shown with three awning hook hangers **10** installed in the utility channel **12**.

~~Figure 5~~ Figure 4 illustrates a front view of a recreational vehicle with an awning deployed. The awning fabric **16** is attached to the awning roller rail **14**. ~~Figure 5~~ Figure 4 also shows three RV awning hook hangers **10** installed in the awning roller rail **14**. It is noted that one or more RV awning hook hangers may be used depending on the needs of the user. The user may want to utilize the RV awning hook hanger singularly to display a windsock or banner, or use several RV hook hangers to support a set of lights or other items. The illustrations and examples provided are for explanatory purposes and are not intended to limit the scope of the appended claims.

What is claimed is:

1. An awning hook bracket for suspending an article from an awning roller rail, said bracket member comprising: a substantially planar body portion having first and second end portions, said first end portion having a substantially cylindrical cross section, said first end portion attached to a substantially planar body, said second end portion having a hook shaped retainer, said second end portion attached to said body, said first end, said body, and said second end being of one-piece integral construction.
2. Said first end as recited in claim 1, wherein the substantially cylindrical cross section, to have a diameter to be accepted into an awning roller rail.
3. Said bracket member as recited in claim 1, wherein said second end portion comprises: an integral hook shaped end for suspending an article from said bracket member.
4. An awning hook bracket as recited in claim 1 formed from a resilient material.

CONCLUSION, RAMIFICATIONS, AND SCOPE OF INVENTION

Accordingly, the reader will conclude that the RV awning hook hanger has several advantages over prior art. By design the RV hook hangers are less expensive to manufacture and package. RV hook hangers are simpler to use for the consumer, as they do not require the use of secondary hardware such as hooks, clips or clamps. Other advantages include but not limited to:

- Provide an awning hanger system that can be manufactured inexpensively.
- A completely portable hanger system for use on RV awnings.
- Provide an awning hanger system that is versatile.
- One-piece design, no "S" hooks, clips or clamps to misplace.
- Holds rope light, tube lights or string lights.
- Holds signs or banners.
- Can be used to hold flags or wind socks.
- Less awkward to install.
- Faster set up and take down of awning lights, or other objects.
- Ease of use, clips slide in the awning roller rail, and are ready to use.
- Weatherproof polycarbonate plastic or other material with UV inhibitors.

Abstract

An RV hook hanger to be used to display items from an awning roller rail. The RV hook hanger includes a top portion that has a substantially cylindrical cross section, mounted on a planar body. The top portion is provided to be accepted by the retainer channel on an awning roller rail. The planar body is attached to a bottom portion of the RV hook hanger. The bottom portion has a hook shaped end for receiving various types of attachments such as signs, lights or the like.
